

Chapter 11

Modern Atomic Theory

Chapter Map

A vertical column of water molecules (H₂O) is shown on the left side of the slide. Each molecule consists of one red oxygen atom and two smaller black hydrogen atoms. The molecules are arranged in a descending staircase pattern from the top left towards the bottom left.

Atomic Theory

- *To see a World in a Grain of Sand
And a Heaven in a Wild Flower
Hold Infinity in the palm of your hand
And Eternity in an hour*
William Blake Auguries of Innocence
- *Thus, the task is not so much to see what
no one has yet seen, but to think what
nobody has yet thought, about that which
everybody sees.*
Erwin Schrodinger

A series of water molecules (H₂O) are arranged in a vertical column on the left side of the slide. Each molecule consists of one red oxygen atom and two smaller black hydrogen atoms. The molecules are positioned at various heights, creating a sense of falling or floating.

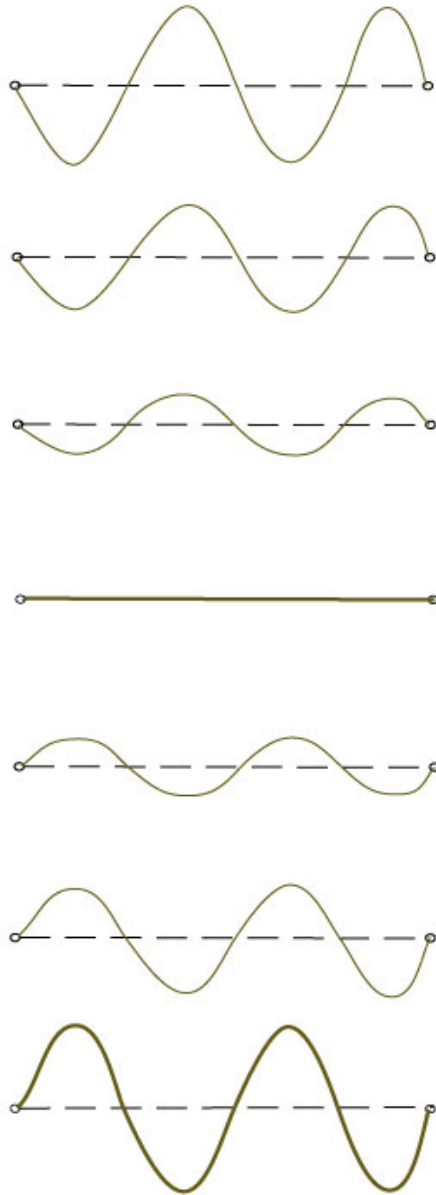

Ways to deal with Complexity and Uncertainty

- **Analogies** In order to communicate something of the nature of the electron, scientists often use analogies. For example, in some ways, electrons are *like* vibrating guitar strings.
- **Probabilities** In order to accommodate the uncertainty of the electron's position and motion, we refer to where the electron *probably is* within the atom instead of where it definitely is.

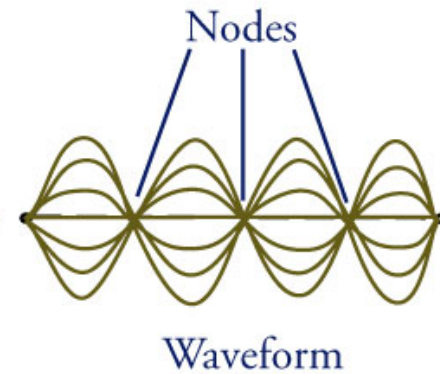

Guitar String Waveform

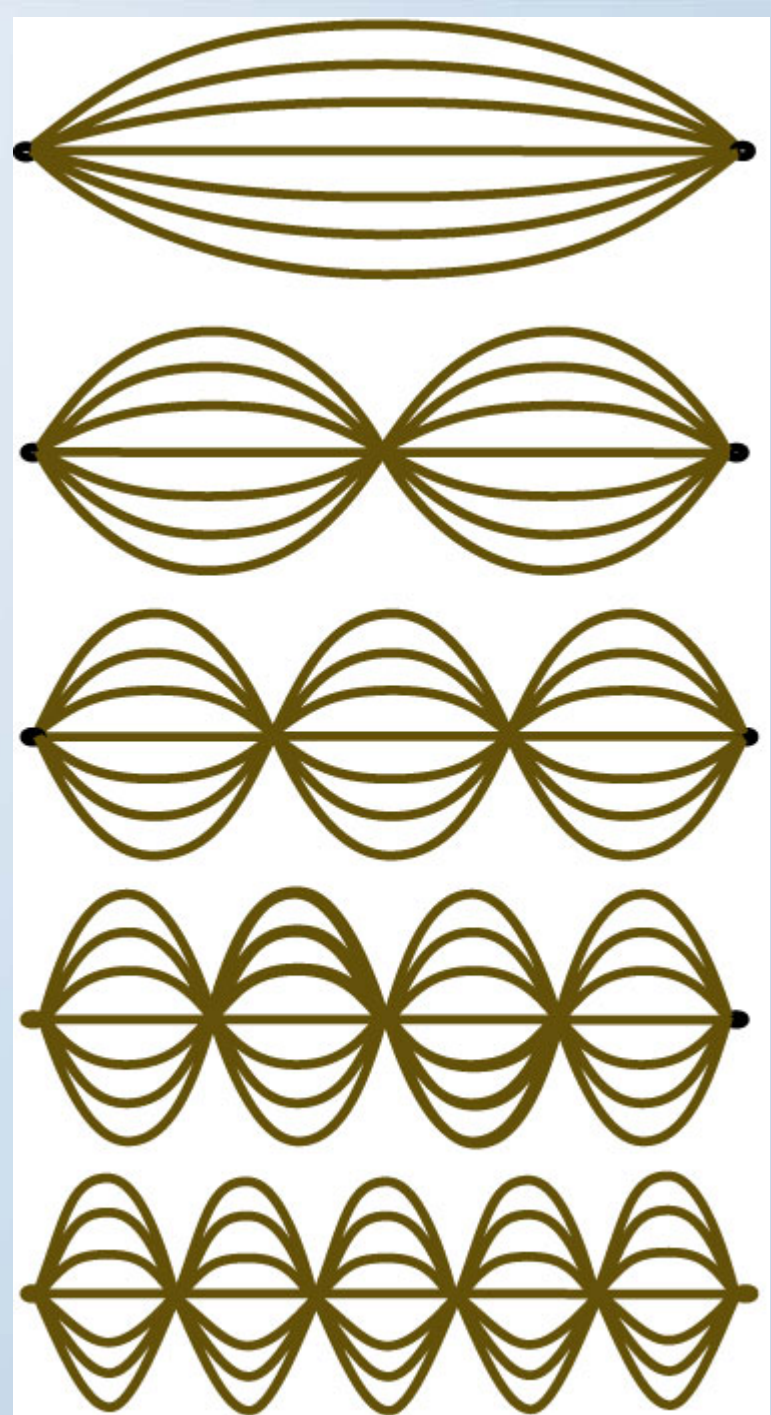

7 possible configurations
for the vibration of a
guitar string

Superimposing the
configurations
produces the
waveform of the
guitar string's
standing wave.

Allowed
Vibrations
for a
Guitar
String

Wave Character of the Electron

- Just as the intensity of the movement of a guitar string can vary, so can the intensity of the negative charge of the electron vary at different positions outside the nucleus.
- The variation in the intensity of the electron charge can be described in terms of a three-dimensional standing wave *like* the standing wave of the guitar string.

Wave Character of the Electron

- Although both the electron and the guitar string can have an infinite number of possible waveforms, only certain waveforms are possible.
- We can focus our attention on the waveform of varying charge intensity without having to think about the actual physical nature of the electron.

Waveform for 1s Electron (with quantum numbers 1,0,0)

Nucleus, about 0.000001
the diameter of the atom

The negative charge is most
intense at the nucleus
and decreases in intensity
with distance outward.

Other Allowed Waveforms

1s Orbital

Almost all of the electron's charge lies within a spherical shell with the diameter of this circle.

Sphere enclosing almost all of the electron's negative charge

Particle Interpretation of $1s$ Orbital

A multiple exposure picture of the electron in a $1s$ orbital of a hydrogen atom might look like this.

2s Orbital

- The 2s orbital for a hydrogen atom is larger than the 1s orbital and has a node, which is a region within the orbital where the charge intensity decreases to zero.

Cutaway of 1s and 2s Orbitals (with quantum numbers 2,0,0)

Ground State and Excited State

- Hydrogen atoms with their electron in the 1s orbital are said to be in their ***ground state***.
- A hydrogen atom with its electron in the 2s orbital is in an ***excited state***.

Realistic and Stylized $2p_y$ Orbital

$2p_x$, $2p_y$, and $2p_z$ Orbitals

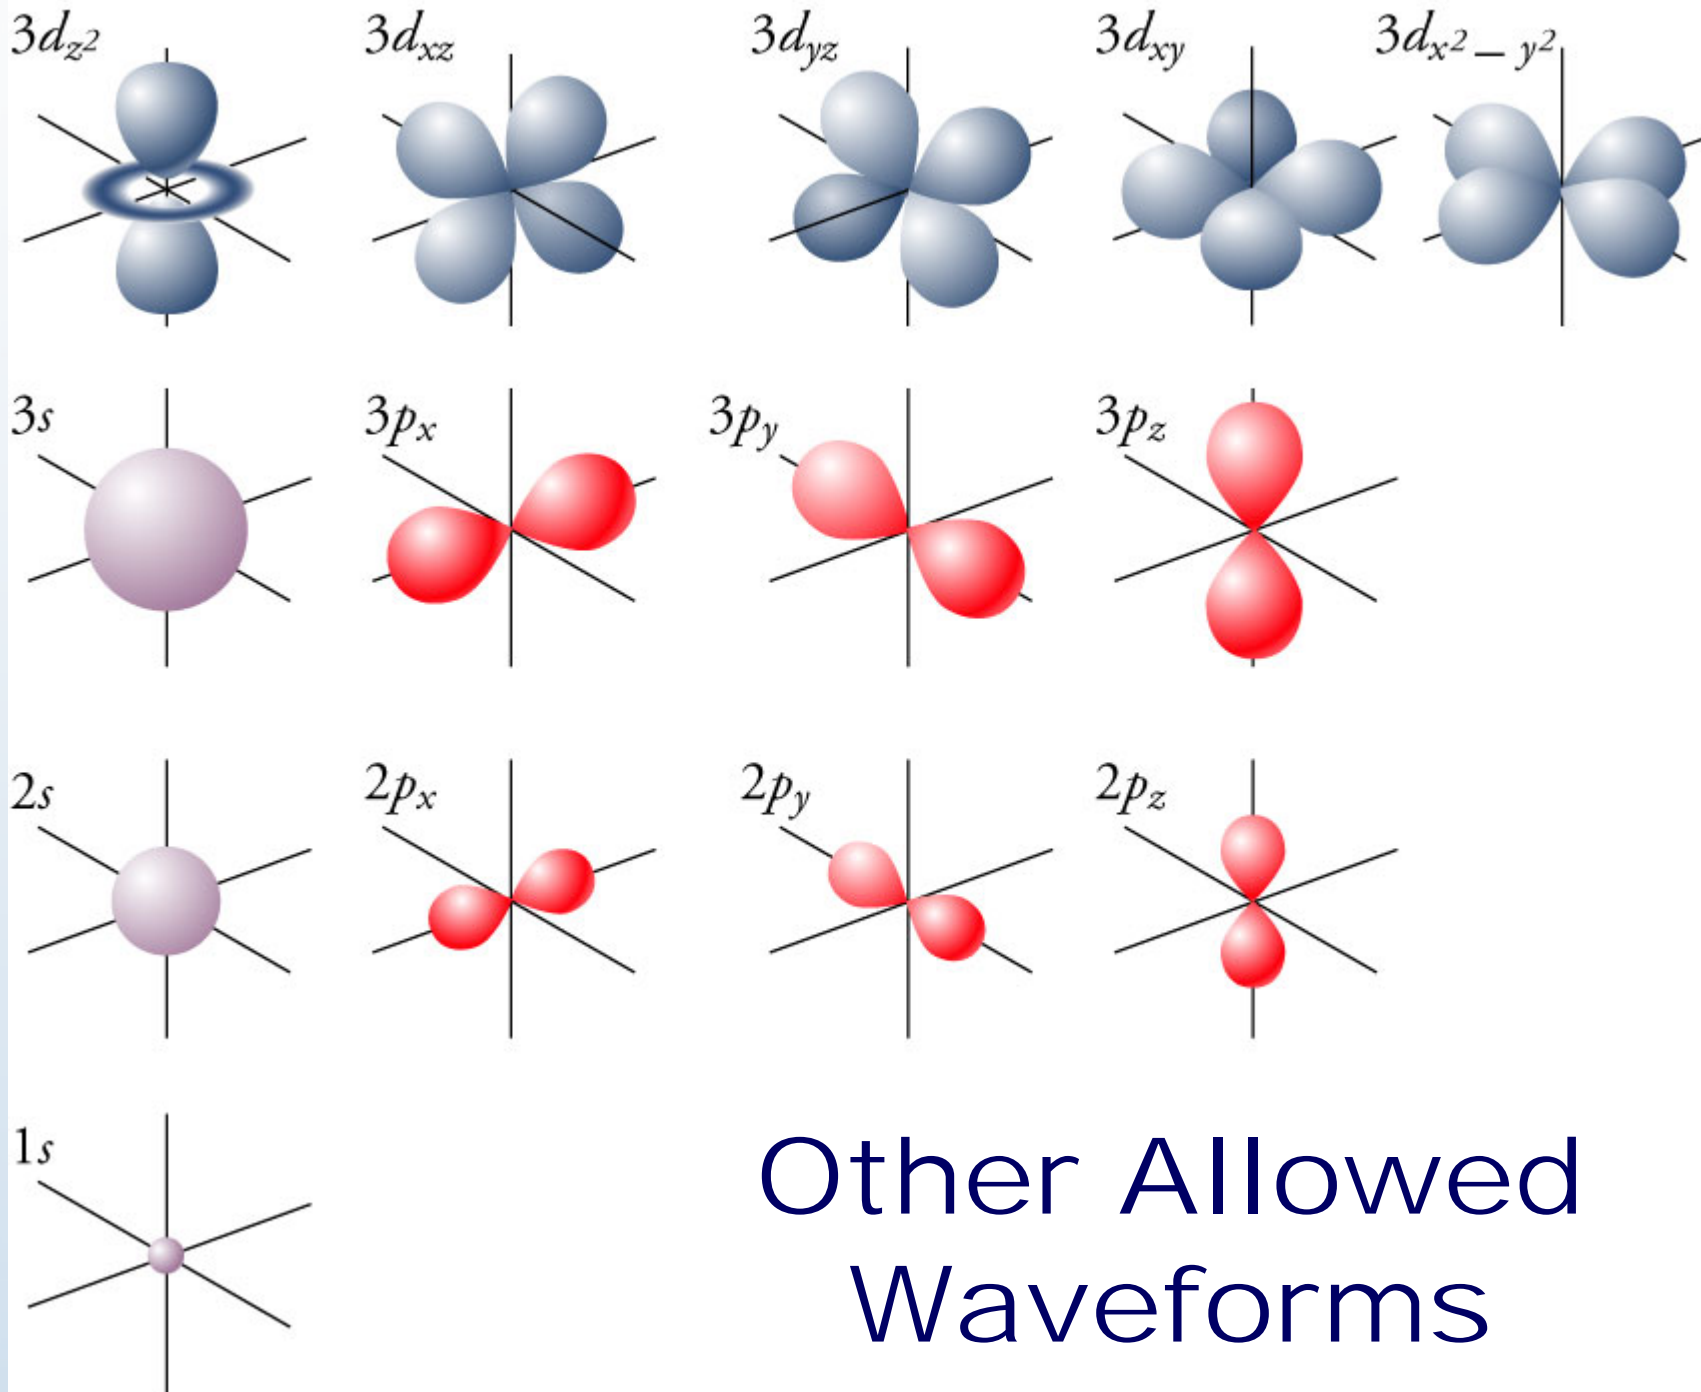

3d Orbitals

Four of the five 3d orbitals have a double dumbbell shape like this one.

The fifth 3d orbital is shaped like a dumbbell and a donut.

Other Allowed Waveforms

Sublevels

- Orbitals that have the same potential energy, the same size, and the same shape are in the same ***sublevel***.
- The sublevels are sometimes called ***subshells***.

Orbitals for Ground States of Known Elements

Electron Spin

Pauli Exclusion Principle

- No two electrons in an atom can be the same in all ways.
- There are four ways that electrons can be the same:
 - Electrons can be in the same principal energy level.
 - They can be in the same sublevel.
 - They can be in the same orbital.
 - They can have the same spin.

Ways to Describe Electrons in Atoms

- Arrows are added to an **orbital diagram** to show the distribution of electrons in the possible orbitals and the relative spin of each electron. The following is an orbital diagram for a nitrogen atom.

- The information in orbital diagrams is often described in a shorthand notation called an **electron configuration**.

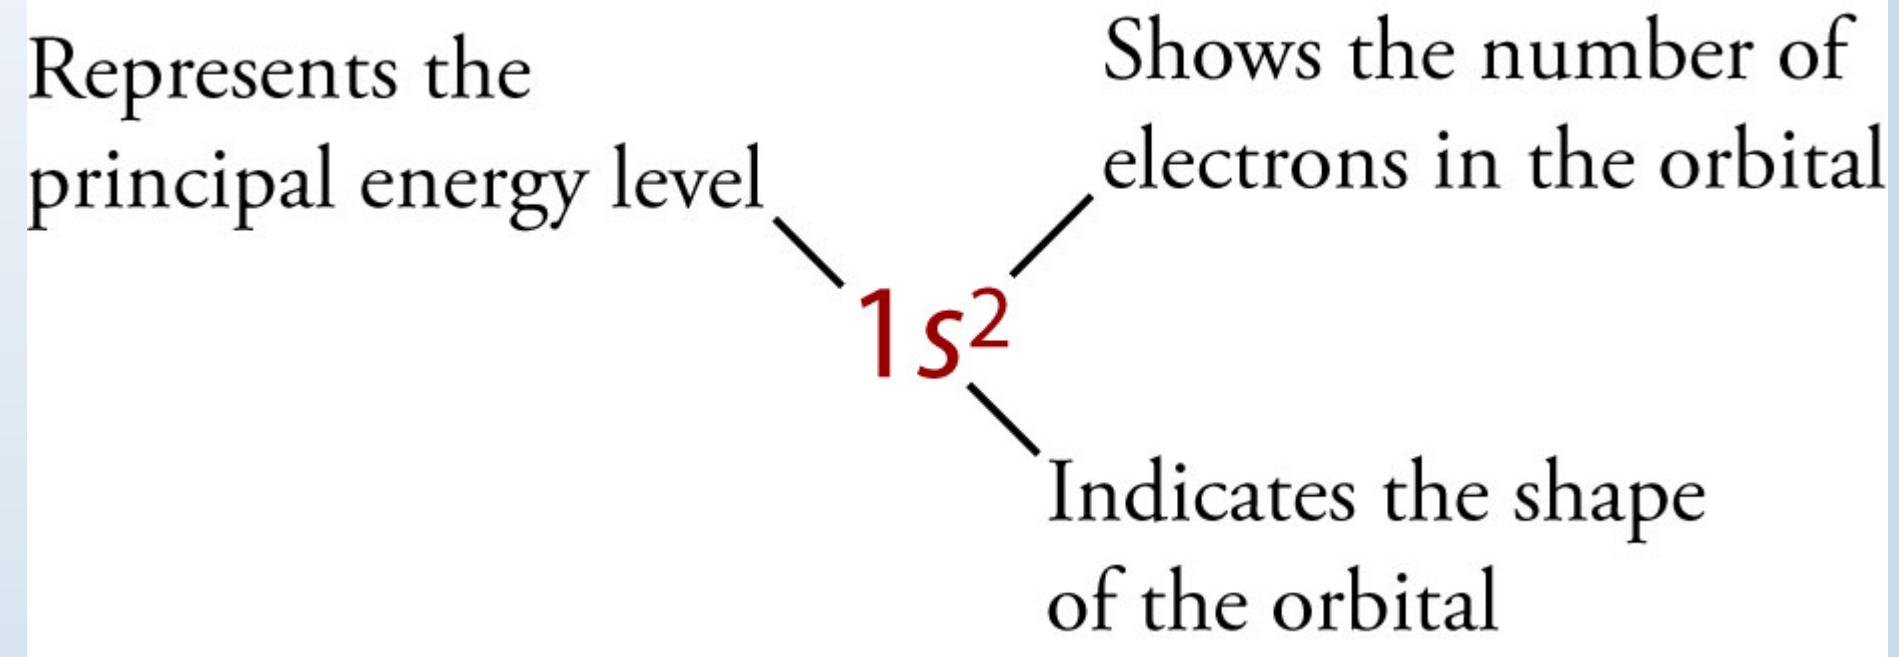

A decorative border on the left side of the slide consists of several water molecules (H₂O) arranged in a vertical column. Each molecule is represented by a large red sphere (oxygen) and two smaller black spheres (hydrogen) bonded to it. The molecules are scattered from the top left towards the bottom left, with some appearing to be inside a flask at the bottom.

Electron Configurations

- The sublevels are filled in such a way as to yield the lowest overall potential energy for the atom.
- No two electrons in an atom can be the same in all ways. This is one statement of the ***Pauli Exclusion Principle***.
- When electrons are filling orbitals of the same energy, they prefer to enter empty orbitals first, and all electrons in half-filled orbitals have the same spin. This is called ***Hund's Rule***.

Electron Configurations (cont.)

Order of Orbital Filling

1s 2s 2p 3s 3p 4s 3d 4p 5s 4d 5p 6s 4f 5d 6p 7s 5f 6d 7p

Writing Electron Configurations

- Determine the number of electrons in the atom from its atomic number.
- Add electrons to the sublevels in the correct order of filling.
- Add two electrons to each *s* sublevel, 6 to each *p* sublevel, 10 to each *d* sublevel, and 14 to each *f* sublevel.
- To check your complete electron configuration, look to see whether the location of the last electron added corresponds to the element's position on the periodic table.

Order of Filling from the Periodic Table

<i>s</i> block		<i>d</i> block										<i>p</i> block					18 8A	
1 1A	2 2A	3 3B	4 4B	5 5B	6 6B	7 7B	8 8B	9 8B	10 8B	11 1B	12 2B	13 3A	14 4A	15 5A	16 6A	17 7A	2	
2s 3	4											2p 5	6	7	8	9	10	1s 1
3s 11	12	3d 21	22	23	24	25	26	27	28	29	30	3p 13	14	15	16	17	18	
4s 19	20	4d 39	40	41	42	43	44	45	46	47	48	4p 31	32	33	34	35	36	
5s 37	38	5d 71	72	73	74	75	76	77	78	79	80	5p 49	50	51	52	53	54	
6s 55	56	6d 103	104	105	106	107	108	109	110	111	112	6p 81	82	83	84	85	86	
7s 87	88											7p 113	114	115	116	117	118	
<i>f</i> block																		
4f	57	58	59	60	61	62	63	64	65	66	67	68	69	70				
5f	89	90	91	92	93	94	95	96	97	98	99	100	101	102				

Drawing Orbital Diagrams

- Draw a line for each orbital of each sublevel mentioned in the complete electron configuration. Draw one line for each s sublevel, three lines for each p sublevel, five lines for each d sublevel, and seven lines for each f sublevel.
- Label each sublevel.
- For orbitals containing two electrons, draw one arrow up and one arrow down to indicate the electrons' opposite spin.
- For unfilled sublevels, follow Hund's Rule.

Abbreviated Electron Configurations

- The highest energy electrons are most important for chemical bonding.
- The noble gas configurations of electrons are especially stable and, therefore, not important for chemical bonding.
- We often describe electron configurations to reflect this representing the noble gas electrons with a noble gas symbol in brackets.
- For example, for sodium

Writing Abbreviated Electron Configurations

- Find the symbol for the element on a periodic table.
- Write the symbol in brackets for the noble gas located at the far right of the preceding horizontal row on the table.
- Move back down a row (to the row containing the element you wish to describe) and to the far left. Following the elements in the row from left to right, write the outer-electron configuration associated with each column until you reach the element you are describing.

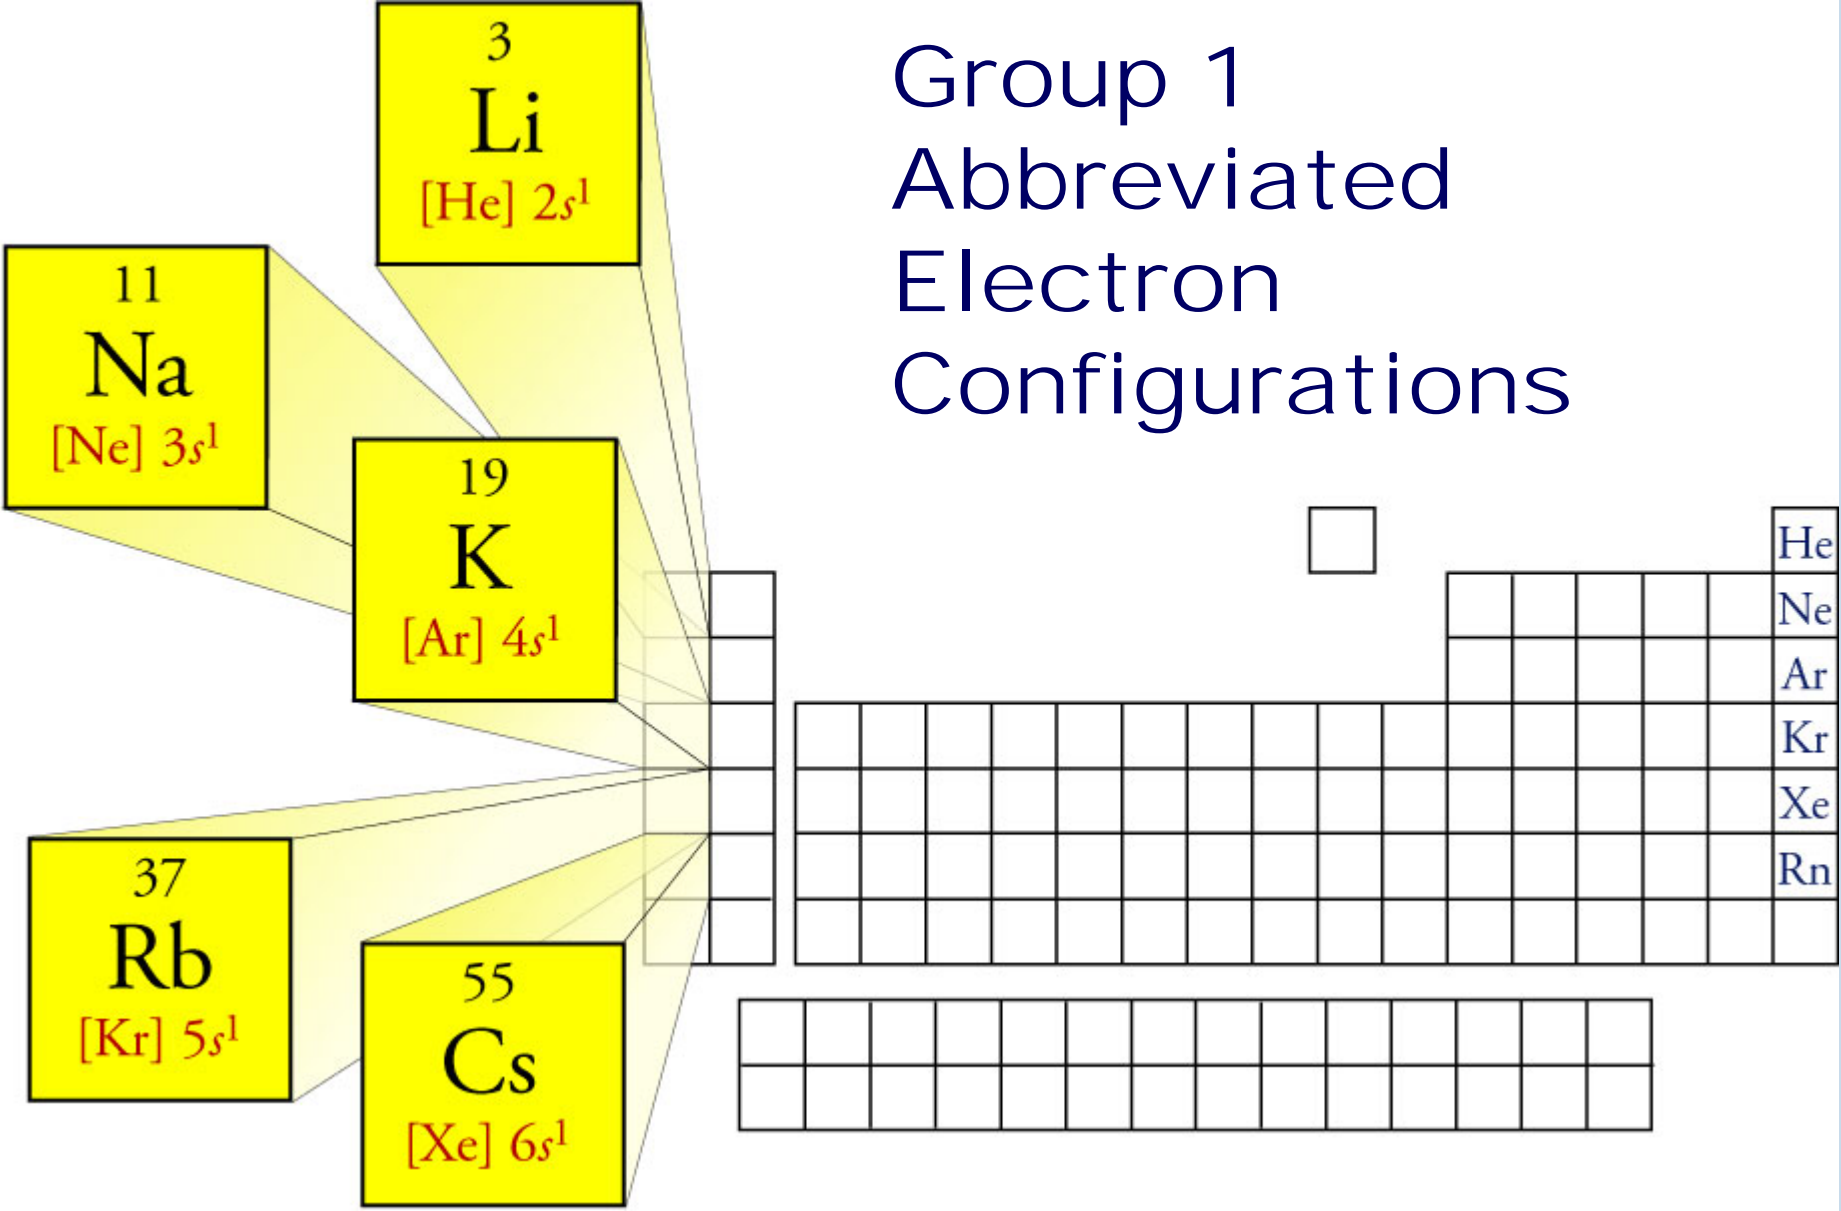

A decorative border on the left side of the slide consists of several water molecules (H₂O) arranged in a vertical line. Each molecule is represented by a large red sphere (oxygen) and two smaller black spheres (hydrogen) bonded to it. The molecules are positioned at various heights, creating a sense of a falling stream.

Abbreviated Electron Configurations – Optional Step

- Rewrite the abbreviated electron configuration, listing the sublevels in the order of increasing principal energy level (all of the 3's before the 4's, all of the 4's before the 5's, etc.)

Group 1 Abbreviated Electron Configurations

Abbreviated Electron Configuration Steps for Zinc

Step 1 Find the symbol for the element (zinc).

Step 2 Write the symbol in brackets for the nearest, smaller noble gas.

Step 3 Write the outer electron configuration for the remaining electrons.

The periodic table is shown with the following elements highlighted:

- Step 1:** Zinc (Zn) at atomic number 30 is highlighted in red.
- Step 2:** Argon (Ar) at atomic number 18 is highlighted in orange.
- Step 3:** The configuration $[Ar] 4s^2 3d^{10}$ is shown. The $[Ar]$ part is in red, $4s^2$ is in green, and $3d^{10}$ is in blue. Arrows point from the text to the corresponding elements in the table.

1 1A		2 2A												13 3A	14 4A	15 5A	16 6A	17 7A	18 8A
3 Li	4 Be											5 B	6 C	7 N	8 O	9 F	10 Ne

Common Mistakes

- Complete electron configurations – miscounting electrons (Use the periodic table to determine order of filling.)
- Orbital diagrams – forgetting to leave electrons unpaired with the same spin when adding electrons to the p , d , or f sublevels (Hund's Rule)
- Abbreviated electron configurations
 - Forgetting to put $4f^{14}$ after [Xe]
 - Forgetting to list sublevels in the order of increasing principal quantum number
 - For cations, forgetting to remove highest energy level electrons first
