An Introduction to Chemistry
by Mark Bishop
Making Phosphoric Acid

- Furnace Process for making $\text{H}_3\text{PO}_4$ to be used to make fertilizers, detergents, and pharmaceuticals.
  - React phosphate rock with sand and coke at 2000 °C.
    \[2\text{Ca}_3(\text{PO}_4)_2 + 6\text{SiO}_2 + 10\text{C} \rightarrow 4\text{P} + 10\text{CO} + 6\text{CaSiO}_3\]
  - React phosphorus with oxygen to get tetraphosphorus decoxide.
    \[4\text{P} + 5\text{O}_2 \rightarrow \text{P}_4\text{O}_{10}\]
  - React tetraphosphorus decoxide with water to make phosphoric acid.
    \[\text{P}_4\text{O}_{10} + 6\text{H}_2\text{O} \rightarrow 4\text{H}_3\text{PO}_4\]
Sample Calculations (1)

• What is the maximum mass of $\text{P}_4\text{O}_{10}$ that can be formed from $1.09 \times 10^4$ kg P?

• Beginning of unit analysis setup.

\[ ? \text{ kg } \text{P}_4\text{O}_{10} = 1.09 \times 10^4 \text{ kg P} \left( \frac{\quad}{1 \text{ kg}} \right) \]

• The formula for $\text{P}_4\text{O}_{10}$ provides us with a conversion factor that converts from units of P to units of $\text{P}_4\text{O}_{10}$.

\[
\frac{1 \text{ molecule } \text{P}_4\text{O}_{10}}{4 \text{ atoms } P}
\]
Sample Calculations (2)

• What is the minimum mass of water that must be added to 2.50 \( \times \) 10^4 kg \( \text{P}_4\text{O}_{10} \) to form phosphoric acid in the following reaction?

\[
\text{P}_4\text{O}_{10} + 6\text{H}_2\text{O} \rightarrow 4\text{H}_3\text{PO}_4
\]

• The coefficients in the balanced equation provide us with a conversion factor that converts from units of \( \text{P}_4\text{O}_{10} \) to units of \( \text{H}_2\text{O} \).

\[
\frac{6 \text{ molecules } \text{H}_2\text{O}}{1 \text{ molecule } \text{P}_4\text{O}_{10}}
\]
Goal: To develop conversion factors that will convert between a measurable property (mass) and number of particles.

\[ \text{? kg } P_4O_{10} = 1.09 \times 10^4 \text{ kg } P \left( \frac{1}{1 \text{ kg}} \right) \]

Measurable Property 1
\[ \downarrow \]
Number of Particles 1
\[ \downarrow \]
Number of Particles 2
\[ \downarrow \]
Measurable Property 2

Mass 1
\[ \downarrow \]
Number of Particles 1
\[ \downarrow \]
Number of Particles 2
\[ \downarrow \]
Mass 2
Counting by Weighing for Nails

• **Step 1:** Choose an easily measurable property.
  – Mass for nails

• **Step 2:** Choose a convenient unit for measurement.
  – Pounds for nails
• **Step 3:** If the measurable property is mass, determine the mass of the individual objects being measured.
  – Weigh 100 nails: 82 are 3.80 g, 14 are 3.70 g, and 4 are 3.60 g

• **Step 4:** If the objects do not all have the same mass, determine the weighted average mass of the objects.
  
  \[
  0.82(3.80 \text{ g}) + 0.14(3.70 \text{ g}) + 0.04(3.60 \text{ g}) = 3.78 \text{ g}
  \]
• **Step 5:** Use the conversion factor from the weighted average to make conversions between mass and number of objects.

\[
\text{? nails} = 218 \text{ lb nails} \left( \frac{453.6 \text{ g}}{1 \text{ lb}} \right) \left( \frac{1 \text{ nail}}{3.78 \text{ g nails}} \right) = 2.62 \times 10^4 \text{ nails}
\]
Counting by Weighing for Nails (cont)

- **Step 6:** Describe the number of objects in terms of a collective unit, such as a dozen, a gross, or a ream.

\[
\frac{\text{? g nails}}{\text{1 gross nails}} = \left( \frac{3.78 \text{ g nails}}{1 \text{ nail}} \right) \left( \frac{144 \text{ nails}}{1 \text{ gross nails}} \right) = \frac{544 \text{ g nails}}{1 \text{ gross nails}}
\]

\[
\text{? gross nails} = 218 \text{ lb nails} \left( \frac{453.6 \text{ g}}{1 \text{ lb}} \right) \left( \frac{1 \text{ gross nails}}{544 \text{ g nails}} \right) = 182 \text{ gross nails}
\]
Counting by Weighing for Carbon Atoms

• **Step 1:** Choose an easily measurable property.
  – Mass for carbon atoms

• **Step 2:** Choose a convenient unit for measurement.
  – Atomic mass units (u) for carbon atoms
  – Atomic mass unit (u) = 1/12 the mass of a carbon-12 atom (with 6 p, 6 n, and 6 e−)
• **Step 3:** If the measurable property is mass, determine the mass of the individual objects being measured.
  – For carbon: 98.90% are 12 u and 1.10% are 13.003355 u.

• **Step 4:** If the objects do not all have the same mass, determine the weighted average mass of the objects.
  \[ 0.9890(12 \text{ u}) + 0.0110(13.003355 \text{ u}) = 12.011 \text{ u} \]
For two reasons, we will skip step 5 where we would have used the weighted average mass, 12.011 u per atom, as a conversion factor.

- The first reason is that we don’t measure mass in unified mass units.
- The second reason is that if we used 12.011 u per atom as a conversion factor, we would get the actual number of atoms, which for any sample of carbon would be a huge and inconvenient number.
• We would rather have a conversion factor that has a more common mass unit, such as grams, and we would rather describe the number of atoms in terms of a collective unit, such as a dozen, a gross, or a ream.

• That collective unit is a mole.
A **mole** (mol) is an amount of substance that contains the same number of particles as there are atoms in 12 g of carbon-12.

To four significant figures, there are $6.022 \times 10^{23}$ atoms in 12 g of carbon-12.

Thus a mole of natural carbon is the amount of carbon that contains $6.022 \times 10^{23}$ carbon atoms.

The number $6.022 \times 10^{23}$ is often called **Avogadro’s number**.
Avogadro’s Number

If the extremely tiny atoms in just 12 grams of carbon are arranged in the line, the line would extend over 500 times the distance between Earth and the sun.
Molar Mass Development

From the definition of mole

\[
\frac{12 \text{ g C-12}}{1 \text{ mol C-12}}
\]

From relative atomic masses

\[
\begin{align*}
\frac{12.011 \text{ g C}}{1 \text{ mol C}} & \quad \frac{24.3050 \text{ g Mg}}{1 \text{ mol Mg}} \\
\frac{15.9994 \text{ g O}}{1 \text{ mol O}} & \quad \frac{1.00794 \text{ g H}}{1 \text{ mol H}}
\end{align*}
\]
The atomic masses found on the periodic table can be used to get molar masses, which can be used to convert between grams and moles of any element. 

\[
\left( \frac{(\text{atomic mass}) \text{ g element}}{1 \text{ mol element}} \right)
\]
Example Calculations

The masses of diamonds and other gemstones are measured in carats. There are exactly 5 carats per gram. How many moles of carbon atoms are in a 0.55 carat diamond? (Assume that the diamond is pure carbon.)

\[
? \text{ mol C} = 0.55 \text{ carat C} \left( \frac{1 \text{ g}}{5 \text{ carat}} \right) \left( \frac{1 \text{ mol C}}{12.011 \text{ g C}} \right) 
= 9.2 \times 10^{-3} \text{ mol C} \left( \frac{6.022 \times 10^{23} \text{ C atoms}}{1 \text{ mol C}} \right) 
= 5.5 \times 10^{21} \text{ C atoms}
\]
• What is the maximum mass of $P_4O_{10}$ that can be formed from $1.09 \times 10^4$ kg P?

Our Calculation

• What is the maximum mass of $P_4O_{10}$ that can be formed from $1.09 \times 10^4$ kg P?

• Here are the general steps for our calculation. We’ll see how to do the first two steps in this lesson, and I’ll tell you how to do the last step in another lesson.

Mass $P \rightarrow$ moles $P \rightarrow$ moles $P_4O_{10} \rightarrow$ mass $P_4O_{10}$
• What is the maximum mass of $\text{P}_4\text{O}_{10}$ that can be formed from $1.09 \times 10^4 \text{ kg P}$?

Mass $\text{P} \rightarrow$ moles $\text{P} \rightarrow$ moles $\text{P}_4\text{O}_{10} \rightarrow$ mass $\text{P}_4\text{O}_{10}$

• We can convert grams of $\text{P}$ to moles of $\text{P}$ using the molar mass of $\text{P}$, which comes from its atomic mass that is found on the periodic table.

\[
\frac{30.9738 \text{ g P}}{1 \text{ mol P}} \quad \text{or} \quad \frac{1 \text{ mol P}}{30.9738 \text{ g P}}
\]
Our Calculation – Step 1

- What is the maximum mass of \( P_4O_{10} \) that can be formed from \( 1.09 \times 10^4 \) kg P?

Mass P → moles P → moles \( P_4O_{10} \) → mass \( P_4O_{10} \)

- Before we can convert grams P to moles P, we need to convert kg to g.

\[
? \text{ kg } P_4O_{10} = 1.09 \times 10^4 \text{ kg P} \left( \frac{10^3 \text{ g}}{1 \text{ kg}} \right) \left( \frac{1 \text{ mol P}}{30.9738 \text{ g P}} \right)
\]

Converts given mass unit into grams.

Converts grams of element into moles.
The chemical formula provides a conversion factor for converting from moles of phosphorus atoms to moles of tetraphosphorus decoxide molecules in the second step of our calculation.

If \[
\frac{1 \text{ molecule } P_4O_{10}}{4 \text{ atoms } P}
\]
then \[
\frac{1 \text{ mol } P_4O_{10}}{4 \text{ mol } P}
\]
Our Calculation – Steps 1 and 2

• What is the maximum mass of $\text{P}_4\text{O}_{10}$ that can be formed from $1.09 \times 10^4$ kg P?
• Here are the first two steps in our calculation.
• We’ll see how to do the last step in another section.

\[
? \text{ kg P}_4\text{O}_{10} = 1.09 \times 10^4 \text{ kg P} \left( \frac{10^3 \text{ g}}{1 \text{ kg}} \right) \left( \frac{1 \text{ mol P}}{30.9738 \text{ g P}} \right) \left( \frac{1 \text{ mol P}_4\text{O}_{10}}{4 \text{ mol P}} \right)
\]

Converts given mass unit into grams. Converts moles of element into moles of compound. Converts grams of element into moles.
Molecular Mass

- Whole = sum of parts
- mass of a molecule = sum of the masses of the atoms in the molecule
- **molecular mass** = the sum of the atomic masses of the atoms in the molecule

\[
\text{Molar mass O: } 15.9994 \text{ g/mol} \\
\text{Molar mass H: } 1.00794 \text{ g/mol} \\
\hline
\text{Molar mass H}_2\text{O: } 18.0153 \text{ g/mol}
\]
• **Molecular Mass** = Sum of the atomic masses of atoms in one molecule

\[
\frac{(\text{molecular mass}) \text{ g molecular compound}}{1 \text{ mol molecular compound}}
\]
Formula Units

• A *formula unit* of a substance is the group represented by the substance’s chemical formula, that is, a group containing the kinds and numbers of atoms or ions listed in the chemical formula.

• Formula unit is a general term that can be used in reference to elements, molecular compounds, or ionic compounds.
Formula Unit Examples

- **neon gas (element)**
  
  A formula unit of neon contains one Ne atom.

- **liquid water (molecular compound)**
  
  Liquid water is composed of discrete H₂O molecules.
  
  A formula unit of water contains one oxygen atom and two hydrogen atoms.

- **ammonium chloride (ionic compound)**
  
  There are no separate ammonium chloride, NH₄Cl, molecules. Each ion is equally attracted to eight others. A formula unit of ammonium chloride contains one ammonium ion, NH₄⁺, and one chloride ion, Cl⁻, (or one nitrogen atom, four hydrogen atoms, and one chloride ion).
Formula Mass for Ionic Compounds

• Whole = sum of parts
• Mass of a formula unit = sum of the masses of the atoms in the formula unit
• **Formula mass** = the sum of the atomic masses of the atoms in the formula

Formula unit
NaCl

Molar mass Na: 22.9898 g/mol
Molar mass Cl: 35.4527 g/mol
Molar mass NaCl: 58.4425 g/mol
Molar Mass For Ionic Compounds

- **Formula Mass** = Sum of the atomic masses of the atoms in a formula unit

\[
\text{(formula mass) g ionic compound} \quad \frac{\text{1 mol ionic compound}}{1 mol ionic compound}
\]
From the definition of an unified atomic mass unit, \( u \)
\[
\frac{12 \text{ g C-12}}{1 \text{ atom C-12}}
\]

From the definition of mole
\[
\frac{12 \text{ g C-12}}{1 \text{ mol C-12}}
\]

From relative atomic masses
\[
\begin{align*}
12.011 \text{ g C} & \quad 24.3050 \text{ g Mg} & \quad 15.9994 \text{ g O} & \quad 1.00794 \text{ g H} \\
1 \text{ mol C} & \quad 1 \text{ mol Mg} & \quad 1 \text{ mol O} & \quad 1 \text{ mol H}
\end{align*}
\]

From relative molecular masses
\[
\frac{18.0153 \text{ g H}_2\text{O}}{1 \text{ mol H}_2\text{O}}
\]

From relative formula masses
\[
\frac{58.4425 \text{ g NaCl}}{1 \text{ mol NaCl}}
\]

Desired units of substance 2

Step 3
• Write a description of the “tip-off” that helps you to recognize the type of problem the calculation represents.

• Write a description of the general procedure involved in the particular type of problem.

• Write an example of the type of calculation.
Sample Study Sheet: Converting Between Mass of Element and Mass of Compound Containing the Element

• **Tip-off:** When you analyze the type of unit you have and the type of unit you want, you recognize that you are converting between a unit associated with an element and a unit associated with a compound containing that element.
• **General Steps**
  
  – Convert the given unit to moles of the first substance.
  
  – Convert moles of the first substance to moles of the second substance using the molar ratio derived from the formula for the compound.
  
  – Convert moles of the second substance to the desired units of the second substance.
Units of Element to Units of Compound

Any unit of an element

Unit analysis conversion factors

Grams of element

Using molar mass derived from atomic mass
\[
\left(\frac{1 \text{ mol element}}{\text{atomic mass}}\right) \text{ g element}
\]

Moles of element

Using the mole ratio from the compound’s formula
\[
\left(\frac{1 \text{ mol compound}}{\text{(number of atoms in formula) mol element}}\right)
\]

Moles of compound containing the element

Using molar mass derived from formula mass
\[
\left(\frac{\text{(formula mass) g compound}}{1 \text{ mol compound}}\right)
\]

Grams of compound

Unit analysis conversion factors

Any unit of a compound
Example Problem

\[ ? \text{ kg} \ P_4O_{10} = 1.09 \times 10^4 \text{ kg} \ P \left( \frac{10^3 \text{ g}}{1 \text{ kg}} \right) \left( \frac{1 \text{ mol P}}{30.9738 \text{ g P}} \right) \left( \frac{1 \text{ mol P}_4O_{10}}{4 \text{ mol P}} \right) \left( \frac{283.889 \text{ g P}_4O_{10}}{1 \text{ mol P}_4O_{10}} \right) \left( \frac{1 \text{ kg}}{10^3 \text{ g}} \right) \]

\[ = 2.50 \times 10^4 \text{ kg} \ P_4O_{10} \]
Empirical and Molecular Formulas

- When the subscripts in a chemical formula represent the simplest ratio of the kinds of atoms in the compound, the formula is called an **empirical formula**.
  - Most ionic compounds are described with empirical formulas.
- A **molecular formula** describes the actual numbers of atoms of each element in a molecule.
Examples of Empirical and Molecular Formulas

- Hydrogen peroxide
  - Molecular formula – $\text{H}_2\text{O}_2$
  - Empirical formula – HO
- Glucose
  - Molecular formula – $\text{C}_6\text{H}_{12}\text{O}_6$
  - Empirical formula – CH$_2$O
Step 1: If you are not given mass in grams for each element, convert the data you are given to grams of each element.

- This may involve simple unit conversions. For example, you may be given pounds or milligrams, which you convert to grams using unit analysis.

- Sometimes you are given the percentage of each element in the compound. Assume that you have 100 g of compound, and change the numbers for the percentages to grams.
Calculating Empirical Formulas

**Step 2:** Convert grams of each element to moles by dividing by the atomic mass of the element.

**Step 3:** Divide each mole value by the smallest and round your answers to whole numbers or common mixed fractions.

**Step 4:** If you have a fraction after the last step, multiply all the mole values by the denominator of the fraction.

**Step 5:** The resulting mole values correspond to the subscripts in the empirical formula.
Calculating Empirical Formulas

Start with

- Any mass unit for each element in the compound
- Percentage of each element in the compound

Unit analysis

Gram ratio of elements

Assume 100 g compound, and convert % to g.

Divide each value by its atomic mass.

Mole ratio of elements

(1) Divide each mole value by the smallest, and round to positive integers or common mixed fractions.
(2) If you have a fraction after step 1, multiply each mole value by the denominator of the fraction.

Simplest molar ratio (empirical formula)
• An ionic compound used in the brewing industry to clean casks and vats and in the wine industry to kill undesirable yeasts and bacteria is composed of 35.172% potassium, 28.846% sulfur, and 35.982% oxygen. What is the empirical formula for this compound?

• **Step 1**: Convert percentages to a gram ratio of the elements by assuming 100 g.
  
  35.172 g K : 28.846 g S : 35.982 g O
Example Empirical Formula Calculation

• An ionic compound used in the brewing industry to clean casks and vats and in the wine industry to kill undesirable yeasts and bacteria is composed of 35.172% potassium, 28.846% sulfur, and 35.982% oxygen. What is the empirical formula for this compound?

• **Step 2:** Convert grams of each element to moles by dividing by the atomic mass of the element.

\[
? \text{ mol K} = 35.172 \text{ g K} \left( \frac{1 \text{ mol K}}{39.0983 \text{ g K}} \right) = 0.89958 \text{ mol K}
\]

\[
? \text{ mol S} = 28.846 \text{ g S} \left( \frac{1 \text{ mol S}}{32.066 \text{ g S}} \right) = 0.89958 \text{ mol S}
\]

\[
? \text{ mol O} = 35.982 \text{ g O} \left( \frac{1 \text{ mol O}}{15.9994 \text{ g O}} \right) = 2.2490 \text{ mol O}
\]
Example Empirical Formula Calculation

- An ionic compound used in the brewing industry to clean casks and vats and in the wine industry to kill undesirable yeasts and bacteria is composed of 35.172% potassium, 28.846% sulfur, and 35.982% oxygen. What is the empirical formula for this compound?

- **Step 3**: Divide each mole value by the smallest and round your answers to whole numbers or common mixed fractions.

\[
\text{? mol K } = \frac{35.172 \text{ g K}}{39.0983 \text{ g K}} = 0.89958 \text{ mol K} / 0.89958 = 1 \text{ mol K}
\]

\[
\text{? mol S } = \frac{28.846 \text{ g S}}{32.066 \text{ g S}} = 0.89958 \text{ mol S} / 0.89958 = 1 \text{ mol S}
\]

\[
\text{? mol O } = \frac{35.982 \text{ g O}}{15.9994 \text{ g O}} = 2.2490 \text{ mol O} / 0.89958 \approx 2 \frac{1}{2} \text{ mol O}
\]
Example Empirical Formula Calculation

• An ionic compound used in the brewing industry to clean casks and vats and in the wine industry to kill undesirable yeasts and bacteria is composed of 35.172% potassium, 28.846% sulfur, and 35.982% oxygen. What is the empirical formula for this compound?

• **Step 4:** If you have a fraction after the last step, multiply all the mole values by the denominator of the fraction.

\[
? \text{ mol } K = \frac{35.172 \text{ g } K}{39.0983 \text{ g } K} \times \frac{1 \text{ mol } K}{39.0983 \text{ g } K} = 0.89958 \text{ mol } K \div 0.89958 = 1 \text{ mol } K \times 2 \approx 2 \text{ mol } K
\]

\[
? \text{ mol } S = \frac{28.846 \text{ g } S}{32.066 \text{ g } S} \times \frac{1 \text{ mol } S}{32.066 \text{ g } S} = 0.89958 \text{ mol } S \div 0.89958 = 1 \text{ mol } S \times 2 = 2 \text{ mole } S
\]

\[
? \text{ mol } O = \frac{35.982 \text{ g } O}{15.9994 \text{ g } O} \times \frac{1 \text{ mol } O}{15.9994 \text{ g } O} = 2.2490 \text{ mol } O \div 0.89958 \approx 2 \frac{1}{2} \text{ mol } O \times 2 \approx 5 \text{ mol } O
\]
An ionic compound used in the brewing industry to clean casks and vats and in the wine industry to kill undesirable yeasts and bacteria is composed of 35.172% potassium, 28.846% sulfur, and 35.982% oxygen. What is the empirical formula for this compound?

**Step 5:** The resulting mole values correspond to the subscripts in the empirical formula.

\[ K_2S_2O_5 \]
Step 1: If necessary, calculate the empirical formula of the compound from the data given.

Step 2: Divide the given molecular mass by the empirical formula mass.

\[ n = \frac{\text{molecular mass}}{\text{empirical formula mass}} \]

Step 3: Multiply each of the subscripts in the empirical formula by \( n \) to get the molecular formula.
Calculating Molecular Formulas

Molecular mass → Simplest molar ratio (empirical formula)

(1) Divide the molecular mass by the empirical formula mass.
(2) Multiply the subscripts in the empirical formula by the value from the preceding step.

Molecular formula
Compounds called polychlorinated biphenyls (PCBs) have structures similar to chlorinated insecticides, such as DDT. They have been used in the past for a variety of purposes, but because they have been identified as serious pollutants, their use today is limited to insulating fluids in electrical transformers. They have been banned for even this use in the U.S., but because they and the transformers last a long time, they are still in many transformers, even in the United States. One PCB is 39.94% carbon, 1.12% hydrogen, and 58.94% chlorine and has a molecular mass of 360.88. What is its molecular formula?
Example Molecular Formulas

One PCB is 39.94% carbon, 1.12% hydrogen, and 58.94% chlorine and has a molecular mass of 360.88. What is its molecular formula?

**Step 1:** If necessary, calculate the empirical formula of the compound from the data given.

\[ ? \text{ mol C} = \frac{39.94 \text{ g C}}{12.011 \text{ g C}} \cdot \frac{1 \text{ mol C}}{12.011 \text{ g C}} = 3.325 \text{ mol C} \div 1.11 \approx 3 \text{ mol C} \times 2 = 6 \text{ mol C} \]

\[ ? \text{ mol H} = \frac{1.12 \text{ g H}}{1.00794 \text{ g H}} \cdot \frac{1 \text{ mol H}}{1.00794 \text{ g H}} = 1.11 \text{ mol H} \div 1.11 = 1 \text{ mol H} \times 2 = 2 \text{ mol H} \]

\[ ? \text{ mol O} = \frac{58.94 \text{ g Cl}}{35.4527 \text{ g Cl}} \cdot \frac{1 \text{ mol Cl}}{35.4527 \text{ g Cl}} = 1.662 \text{ mol Cl} \div 1.11 = 1\frac{1}{2} \text{ mol Cl} \times 2 = 3 \text{ mol Cl} \]

Empirical formula: \( \text{C}_6\text{H}_2\text{Cl}_3 \)
One PCB is 39.94% carbon, 1.12% hydrogen, and 58.94% chlorine and has a molecular mass of 360.88. What is its molecular formula?

**Step 2:** Divide the given molecular mass by the empirical formula mass.

**Step 3:** Multiply each of the subscripts in the empirical formula by \( n \) to get the molecular formula.

Empirical formula: \( \text{C}_6\text{H}_2\text{Cl}_3 \)

\[
n = \frac{\text{molecular mass}}{\text{empirical formula mass}} = \frac{360.88}{180.440} \approx 2
\]

Molecular formula: \( \text{C}_{12}\text{H}_4\text{Cl}_6 \)
